IMPORTANT

Tips To Make
 Pool Opening Easier

It is better to open your pool too early than too late. The longer the water stagnates, the worse it will get. Algae begins to grow at a water temperature of about 55. Don't wait until it is 80° outside to open your pool!

Step 1: Add liquid chlorine around the edge of the pool, mostly in the deep end.

Step 2: Add liquid Algae All 60 or Back Up to the shallow & deep end of the pool.

Step 3: Keep leaves and debris off Pool Cover

Save by opening early

Over the years we have learned that the earlier you open your pool, the less trouble you will have with your water cleanup. In Fact, those who open earlier usually reduce other expenses related to pool start-up. If you do not intend to open your pool early, you may consider adding some liquid chlorine and BioGuard Banish this works well without your pool circulating.

On Sale Now

1 case Liquid Chlorine
and 1 qt. Banish

Spa Maintenance

Regular Maintenance Keeps Spas Clean, Safe and Fun

Like a swimming pool, your spa needs regular care and maintenance to keep it clean, safe and functioning properly. It only takes a few steps and a few minutes each week to make it happen.

Clean Your Filter Cartridges

Considering the amount of circulation and filtering needed to keep a spa clean, weekly filter cleaning is probably the most important step. To avoid any downtime with your spa, it's a good idea to have an extra filter on hand — so when it's time to clean, you can just pop in filter #2 and keep the spa going while you clean filter #1.

Keep the Spa Clean

A skimmer net is handy for quickly scooping up any debris that makes its way into your spa, and a cover is essential for keeping debris out when

your spa isn't in use. It's also a good idea to drain, clean and refill your spa every three months. Unless you are using SilkBalance or have a salt water spa.

Use Your Test Kit Often

The chemical balance in your spa is just as important as that of your pool. Depending on how frequently you use your spa, you may need to check the chemistry a few times a week to maintain the proper pH and chlorine levels. A good rule of thumb is to check it weekly.

Have your chemicals EXPIRED? Check your supplies

Check expiration dates on all pool chemical containers. Cleaning supplies that are past expiration should be properly disposed of and replaced with new chemicals. Also remember that if a chemical was not properly sealed before being stored in the off-season, you need to replace that as well.
