

DIFFERENTIAL SERVICE

PROBLEM

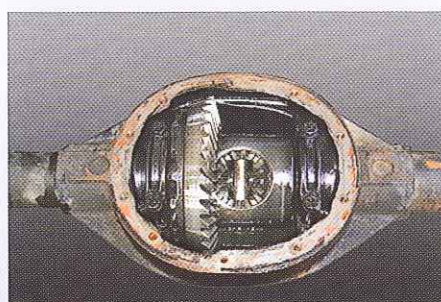

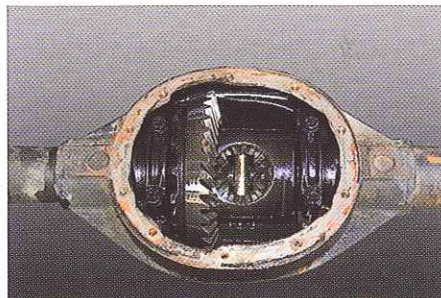

- Differentials are typically neglected and minor problems are often ignored.
- Differential gear oil degrades over time due to heat, pressure and contamination.
- Oil performance additives eventually lose their ability to protect differential gears.

SOLUTION

- Using a special differential fluid service machine, all old gear oil is removed from the differential case.
- After removal, the differential case is filled with Wynn's 75W-90 or 75W-140 Synthetic Gear Oil.
- If a limited-slip differential is being serviced, Wynn's Friction Modifier for Limited Slip Differentials is added.
- For added protection, Wynn's High Performance Lube Supplement may also be added.

FEATURES/BENEFITS

- All differential gear oil is removed and replaced.
- Protects differential gears from excessive wear and deterioration.
- Extends the life of differential gears.
- Provides smooth operation.

Neglected differential fluid can lead to sludge and deposit buildup (top), which may cause excessive wear and deterioration of the differential gears.

EQUIPMENT

- Wynn's DiffServ™ Differential Fluid Service Machine

PRODUCTS

- Wynn's 75W-90 Synthetic Gear Oil
- Wynn's 75W-140 Synthetic Gear Oil
- Wynn's Friction Modifier for Limited Slip Differentials
- Wynn's High Performance Lube Supplement
