

THE ASSEMBLY PROFESSIONALS

Problem

Lead is considered a hazardous material to the environment. As a result, the disposal of used wheel weights has become a concern to large volume users of wheel weights.

Not to mention the clutter and mess caused by used wheel weights and lack of inventory control.

In addition to used wheel weight disposal, finding the proper wheel weight for the rim is also becoming a challenge to the automotive industry. With the large variety of rims on the market, and new ones being developed constantly, having a supplier with an extensive line of wheel weights is critical. When the wrong wheel weight is installed on a vehicle it can fly off causing damage, improper tire wear and performance problems.
