

My Pool has a Chlorine Demand What do I do?

You have two choices...

Shock the pool with 1 lb. of ProTeam Lithium per 10,000 gallons. Let the water circulate for 3 hrs and retest. Continue shocking and retesting every 3 hrs until you can maintain a 3 ppm or higher free chlorine reading for 24 hrs.

OR

It may be a more feasible option to perform a partial drain (about 2.5 feet) and refill with fresh water to reduce the demand. Then, shock the pool with 1 lb. of ProTeam Lithium per 10,000 gallons and let circulate for 3 hrs until you can maintain a 3 ppm or higher free chlorine reading for 24 hrs.

Bring in your water & have Stuart Bauer Pools check to confirm the chlorine reading
